Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. scale 0.231 Mean 32.851; Variance 142.196; Statistics:

PT	Synergistic antiviral composition contains B7GF and sulphated
PT	polysaccharide - for treating viral infections e.c. HSV-1 and -2,
PT	cytomegalovirus, HIV, influenza virus etc.
PS	Disclosure; Page 4; 20pp; English.
ပ္ပ	This sequence represents acidic fibroblast growth factor (aFGF).
ပ္ပ	aFGF, or its fragments may be used in a synergistic compsn. with an
ပ္ပ	antivirally active sulphated polysaccharide, and one or more
႘	excipients. The compsn. may be used to control herpes simplex virus
႘	(HSV-1 or -2) herpes varicella/zoster; cytomegalovirus; influenza;
មួ	human respiratory syncytial virus; Semliki Forest virus; HIV or
ខ	Moloney Sarcoma virus. The combination of aFGF with sulphated
႘	polysaccharide is found to have a greater antiviral activity than
ပ္ပ	expected for an additive effect. See also R25913-5.

                                                                                       Claim 2. Column 30: 25pp; English.
Oligonucleotides were synthesized on the basis of the amino acid
sequence of bovine acidic fibroblast growth factor (aFGF) and
used to produce a synthetic gene (given in Q88233) incorporating.
codons preferred by E. coli or mammalian cells, unique cloning
sites, etc. This synthetic gene was mutagenized to obtain a gene
encoding a human recombinant aFGF (R74647) having activity

DNA encoding FGF mutein Disclosure; Page 3: 23pp; Japanese. The invention covers muteins of FGF (esp. bFGF) which contain at least one glycosylation site. The muteins can be used to treat burns and thrombosis.

isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels Disclosure; Fig 8: 28pp: English.

Bovine beta-endothelial cell growth factor (beta-ECGF; W03999) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (737503) or fragments may be obtained using oligonucleotides (737504 to 737508 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence of human proteinaceous factor (PF1) with mitogenic activity. Cell growth promoter; mitogen; vascularisation; wound healing. Homo saplens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mitogenic polypeptide isolated from human brain tissue - useful for increasing vascular effect in eq wound healing, or generating endothelial cell linings for vascular prostheses, etc. (Claim 3: Page 1; 31pp; English.

The PF of the invention was obtd. from human brain tissue. It has a moi. wt. of 15,200-16,500 (pref. 15,501-16,505) and has a high affinity for heparin. PF1 and fragments are useful for promoting the growth of mesoderm-derived cells on neuroectoderm-derived cells and generating endothelial cell linings for vascular prostheses (all sequence 140 AA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Disclosure; Fig 1; 19pp; Japanese.

The was deduced from a gene used to produce recombinant aFGF.

Peptides derived from the protein, esp. from A-D can be used to as antigens to produce anti-aFGF antibodies. The peptides must comprise 8-10 continuous AAs from A or B (claims 5 and 6 resp.), 7-10 continuous AAs from C (claim 7), or 8-9 continuous AAs from D (claims 9). The Abs can be used for immunochemically measuring aFGF, and for purifying aFGF. They are useful as reagents in the diagnosis of various cancers or diseases of the CNS. Purified aFGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

DNR encoding a cleavable signal peptide and an endothelial cell
DNR hactor - useful for producing recombinant endothelial cell
growth factor proteins
Claim 1; Column 16; 23pp; English.
This represents the amino acid sequence of human beta-endothelial cell
growth factor (EGGF). The invention is directed to DNR encoding alpha-
or beta-EGGF and plasmids comprising the DNR sequences. The DNR encodes a
cleavable signal peptide and an EGGF, where removal of the signal peptide
signal peptide and an EGGF. The DNR is used to produce recombinant
EGGF proteins, which can be used in treatments to repair or regenerate
blood vessels, or other structures lined with endothelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; Fig 8: 28pp; English.

Bovine beta-endothelial cell growth factor (beta-ECGF; W0399) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures. Human ECGF (737503) or fragments may be obtained using oligonucleotides (737504 and 737508 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                78 YLAMDTDGLLYGSQTPNEECLFLERLEENHYNTYISKKHAEKNWFVGLKKNGSCKRGPRT 137

Claim 2, Fig 33, 12pp; English.

Claim 2, Fig 33, 12pp; English.

Claim 2, Fig 34, 12pp; English.

The synthetic affg gene incorporates useful restriction sites at frequent intervals to facilitate the cassette mutagenesis of selected regions. Also included are flanking sites to simplify the incorporation of the gene into any expression system.

The affg mol. acts in a cascade effect to control endothelial cell activity either co-ordinately through synergistic effects or via independent routes. The regulation of endothelial cells is essential for the protection of arteries, veins and capillaries from the effect of thrombogenesis. Their stimulation and control by these factors is also thought to be important in the development of tumours and

Human recombinant endothelial cell growth factors (ECGF) beta
(W06816) and alpha (W06817) differ only at their N-terminal ends.
They can be produced in transformed prokaryotic or eukaryotic host cells using DNA sequences (745983 and 745984, respectively) derived from the complete human ECGF cDNA (745985). Large quantities of the ECGFs are produced by culturing the host cells and recovering the proteins. ECGFs have utility in the growth and amplification of endothelial cells in culture. They can potentially be used to treat damaged blood vessels and other endothelial cell-lined structures, and also have diagnostic applns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
cell growth factor polypeptides
Claim 1: Column 16: 23pp: English.
This sequence represents the amino acid sequence of the mature human
beta-endothelial cell growth factor (b-ECGF). This amino acid sequence
is identical to the alpha-ECGF but the beta sequence contains an extra
20 N-terminal amino acids. The sequence was isolated from a human brain
stem cell cDNA library using a probe designed based on fragments of the
bovine ECGF (see W75416-W75418). The ECGF protein can be used in
compositions for promoting wound healing. ECGF is also used to grow
cells on a prosthetic device.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                             Human endothelial cell growth factor - produced by recombinant DNA techniques, useful for wound healing Example; Fig 8; 45pp; English.

Example; Fig 8; 45pp; English.

To screen the human brain stem CDNA library for clones contg. ECGF inserts, a specific oligonucleotide was designed. This colligonucleotide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see F70480 and P70481). Fig 3c sets forth for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleot acid sequence is shown in Fig 8 (see N70788 and P70482).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      19 PPGNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQ 78

##experimental_source heart libroblast growth factors are the major
NT pe acidic and basic fibroblast growth factors are the major
endothelial-cell growth factors. Both are angiogenic agents in
vivo and are potent mitogens for a variety of mesodern-derived
cell types in vitro (although bFGF is 30-100 times more potent
than aFGF in stimulating the proliferation of normal diploid
cells). There are differences in the tissue distribution and
concentration of these two growth factors.

This protein binds heparin, although less strongly than does bFGF
NT There are some sequence similarities between residues 117-126 (a

#title Molecular cloning of amphiglycan, a novel integral membrane
heparan sulfate proteoglycan expressed by epithelial and
fibroblastic cells.
#cross-references MID:92363936
#accession $26695
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 chondroitin sulfate proteoglycan; core protein; glycoprotein; heparan sulfate; transmembrane protein
  protein: Molecular cloning and
of the cDNA, and chromosomal localization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       #domain signal sequence #status predicted #label SIG\

NT The acidic and basic fibroblast growth factors are the major
endothelial-cell growth factors. Both are angiogenic agents in
vivo and are potent mitogens for a variety of mesoderm-derived

cell types in vitro (although bFGF is 30-100 times more potent
than aFGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This protein binds heparin more strongly than does aFGF.

"Molecular cloning, genomic organization, promoter activity, and
tissue-specific expression of the mouse ryudocan gene.";
J. Blochem. 122:17-24(1997).
I. FUNCTION: CELL SURFACE PROTEOGLYCAN THAT BEAR HEPARAN SULFATE.
I. SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
I. TISSUE SPECIFICITY: UBIQUITOUS.
I. SIMILARITY: BELONGS TO THE SYNDECAN FAMILY OF INTEGRAL MEMBRANE
PROTEOGLYCANS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mus musculus (Mouse).

-! FUNCTION: CELL SURFACE PROTEOGLYCAN THAT BEARS BOTH HEPARAN
SULFATE AND CHONDROITIN SULFATE AND THAT LIRKS THE CYTOSKELETON TO
THE INTERSTITIAL MATRIX. BINDS BASIC FIBROBLAST GROWTH FACTOR.
